Your season is Fall!

Hello, Data Detectives!

Your assigned season is fall. In this mission, you'll explore real fall weather data from Indiana, including one week of temperature, rainfall, and soil moisture. You'll also receive data from a second week in October — and that's where your detective work begins!

Your tasks:

- Use the second week's data to create three graphs:
    - A line graph for temperature
    - A histogram for soil moisture
    - A box plot to show data distribution

You'll also receive a chart showing the ideal growing conditions for corn. Compare it with the fall data to decide: *Is fall a good season for corn to grow?*

You'll also notice two types of measurements in your file — metric and standard. Take a peek! Don't worry if it's confusing; your teacher will explain it in the next part.

Bonus Challenge!

How do you think corn feels in fall? Happy? Sleepy? Sad?

Use your creativity to draw a cartoon of corn showing its falltime feelings.

Checklist for Success:

- Review the first week's data and graphs
- Make a line graph (temperature) for the second week
- Create a histogram (soil moisture)
- Build a box plot (soil moisture)
- Draw your creative corn cartoon

- Write a short reflection: What did you learn from this activity?

And remember — if you get stuck, your teacher is here to help.

Good luck, detectives… you've got this!

Corn Happy Conditions:

Temperature:

- Ideal range: 15 – 30 °C
- Corn germinates best: 18 – 29 °C
- Growth slow blow 10°C or above 35°C

Soil Moisture:

- Optimal range: 35 – 40 %
- Corn prefers consistently moist, well-drained soil

Too dry= wilting / To wet= root rot
